## The ANY-maze Photobeam arrays

## Overview

The ANY-maze photobeam arrays provide a 'curtain' of photobeams, and are often used to detect when an animal rears. They can also be used as movement detectors, generating reliable movement 'counts' in circumstances in which video tracking can't be used.

## Details

- Available in $20 \mathrm{~cm}, 40 \mathrm{~cm}$ and 100 cm widths.
- Connect directly to the ANY-maze Digital interface.
- Maximum separation between the emitter and receiver is 100 cm .
- 1.25 cm spacing between beams.
- Beams are read at minimum of 10 Hz .
- Individual beams can be independently enabled and disabled - very useful if the apparatus includes something which will normally block some beams.
- Can be supplied with a stand and base.
- 2.75 metre cable terminated with a pluggable screw terminal block for connection to an ANY-maze Digital interface port.

## Part numbers

| Part number | Width | Includes stand |
| :--- | :--- | :--- |
| $60001-01$ | 20 cm | Yes |
| $60001-01 \mathrm{~A}$ | 20 cm | No |
| $60001-02$ | 40 cm | Yes |
| $60001-02 \mathrm{~A}$ | 40 cm | No |
| $60001-03$ | 100 cm | Yes |
| $60001-03 \mathrm{~A}$ | 100 cm | No |

## Technical specification

| Electronic | Proprietary - connects directly to ANY- <br> maze Digital interface |
| :--- | :--- |
| Connection | 10 Hz (minimum) (note 1) |
| Read frequency | 25 mA |
| Supply current | 880 nm |
| Emitter wavelength |  |
| Mechanical | $20 \mathrm{~cm}, 40 \mathrm{~cm}, 100 \mathrm{~cm}$ |
| Array width (distance between first and last beams) | 110 cm |
| Maximum separation (distance between emitter and receiver) | 12.5 mm |
| Beam spacing (distance between one beam and the next) | 120 cm |
| Cable length between emitter and receiver | 275 cm |
| Cable length between emitter and ANY-maze Digital interface |  |

## Notes

1. In order not to compromise the minimum read frequency, only three 40 cm arrays, or one 100 cm array, can be connected to a single ANY-maze Digital interface. The interface itself enforces this rule.
